Perspectives

- ▶ A *Garside monoid* is a pair (M, Δ) where M is a monoid and $\Delta \in M$, such that

- ▶ M is left- and right-cancellative,
- ▶ There is a function $\lambda : M \rightarrow \mathbb{Z}_{\geq 0}$ such that

$$\lambda(ab) \geq \lambda(a) + \lambda(b) \quad \text{and} \quad a \neq 1 \Rightarrow \lambda(a) \neq 0,$$

- ▶ Every two elements of M admit both a gcd and a lcm (for both left- and right-divisibility),

- ▶ A *Garside monoid* is a pair (M, Δ) where M is a monoid and $\Delta \in M$, such that

- ▶ M is left- and right-cancellative,
- ▶ There is a function $\lambda : M \rightarrow \mathbb{Z}_{\geq 0}$ such that

$$\lambda(ab) \geq \lambda(a) + \lambda(b) \quad \text{and} \quad a \neq 1 \Rightarrow \lambda(a) \neq 0,$$

- ▶ Every two elements of M admit both a gcd and a lcm (for both left- and right-divisibility),
- ▶ The set of left divisors of Δ coincides with the set of its right-divisors, and generates M ,

- ▶ A *Garside monoid* is a pair (M, Δ) where M is a monoid and $\Delta \in M$, such that

- ▶ M is left- and right-cancellative,
- ▶ There is a function $\lambda : M \rightarrow \mathbb{Z}_{\geq 0}$ such that

$$\lambda(ab) \geq \lambda(a) + \lambda(b) \quad \text{and} \quad a \neq 1 \Rightarrow \lambda(a) \neq 0,$$

- ▶ Every two elements of M admit both a gcd and a lcm (for both left- and right-divisibility),
- ▶ The set of left divisors of Δ coincides with the set of its right-divisors, and generates M ,
- ▶ The set $\text{Div}(\Delta)$ of divisors of Δ is finite.

- ▶ A *Garside monoid* is a pair (M, Δ) where M is a monoid and $\Delta \in M$, such that

- ▶ M is left- and right-cancellative,
- ▶ There is a function $\lambda : M \rightarrow \mathbb{Z}_{\geq 0}$ such that

$$\lambda(ab) \geq \lambda(a) + \lambda(b) \quad \text{and} \quad a \neq 1 \Rightarrow \lambda(a) \neq 0,$$

- ▶ Every two elements of M admit both a gcd and a lcm (for both left- and right-divisibility),
 - ▶ The set of left divisors of Δ coincides with the set of its right-divisors, and generates M ,
 - ▶ The set $\text{Div}(\Delta)$ of divisors of Δ is finite.
- ▶ A Garside monoid satisfies Ore's conditions (cancellativity + existence of common multiples), hence can be embedded into a group of left-fractions $G(M)$ (called a *Garside group*) having the same presentation as M .

- ▶ A *Garside monoid* is a pair (M, Δ) where M is a monoid and $\Delta \in M$, such that

- ▶ M is left- and right-cancellative,
- ▶ There is a function $\lambda : M \rightarrow \mathbb{Z}_{\geq 0}$ such that

$$\lambda(ab) \geq \lambda(a) + \lambda(b) \quad \text{and} \quad a \neq 1 \Rightarrow \lambda(a) \neq 0,$$

- ▶ Every two elements of M admit both a gcd and a lcm (for both left- and right-divisibility),
 - ▶ The set of left divisors of Δ coincides with the set of its right-divisors, and generates M ,
 - ▶ The set $\text{Div}(\Delta)$ of divisors of Δ is finite.
- ▶ A Garside monoid satisfies Ore's conditions (cancellativity + existence of common multiples), hence can be embedded into a group of left-fractions $G(M)$ (called a *Garside group*) having the same presentation as M . Garside groups have solvable word and conjugacy problems, are torsion free, have a non-trivial center, a finite $K(\pi, 1)$ space, are biautomatic, ...

Theorem

Let $n, m \geq 2$ be two relatively prime integers. The Garside structure introduced above for $\mathcal{G}(n) \cong G(n, n+1)$ can be generalized to all torus knot groups $G(n, m)$. That is, there is a Garside monoid $\mathcal{M}(n, m)$ generalizing the construction given above (hence with $\mathcal{M}(n) = \mathcal{M}(n, n+1)$), such that the corresponding Garside group $\mathcal{G}(n, m)$ is isomorphic to the torus knot group $G(n, m)$.
